EXPERIENCE

Associate Software Engineer - Visa | Denver, CO July 2025 - Present

- Enabled shared balances via joint-account linkages, migrating an account and all associated entities from distributed shards to a co-located shard and partition in under 5 seconds end-to-end by building an asynchronous message-driven migration pipeline and refining data-layer queries to use index seeks over partitioned indexes.
- Eliminated container restart-on-change config deployments for Card Account Profile processing APIs by building a Kafka change-event consumer microservice that triggers targeted cache refreshes, serving any of 46 client configurations on demand with near-real-time consistency.
- Supported release deployments spanning 91 million accounts by owning the Forward SQL and Qlik Replication codebases, while maintaining availability of non-production SQL Server environments as Dev SRE for integration, QA, and performance engineering teams.
- Reduced SQL Server schema-change workflows (new columns/tables across SQL and Qlik Replication) from a week of manual work to a single CLI command by building agentic AI skills that automate the end-to-end process.

AI Studio Fellow - Resolvly | Los Angeles, CA August 2024 - Dec 2024

- Improved training-input reliability for an AI-powered recommendation model by consolidating 32 raw datasets into a feature-engineered corpus through exploratory analysis and preprocessing with pandas and scikit-learn.
- Delivered the recommendation system's first working models by implementing k-means clustering to segment colleges and supervised-learning components for match prediction.

Student Independent Research Intern - NASA JPL | Pasadena, CA February 2023 – May 2023

- Reduced ECCO dataset user guide creation time by ~60% (100 hrs to 40 hrs) by building a reusable LaTeX template and CLI workflow for automated dataset visualization and table generation.
- Streamlined processing of all 90 ECCO sea-ice datasets into a one-command Python workflow by authoring scripts leveraging numpy, xarray, and matplotlib.

PROJECTS

LobbyLens | Java/Spring Boot, React/TypeScript, PostgreSQL | lobbylens.duckdns.org August 2026

- Built a real-time dashboard for simulated multiplayer game sessions: per-simulation OS-process workers under a custom supervisor, versioned WebSocket protocol, and per-second metrics/logs streamed to the browser via SSE.
- Built the React/TypeScript frontend with a custom SSE client (event deduplication, bounded replay, watchdog reconnects) feeding an external store into dependency-free SVG telemetry charts.
- Deployed to a hardened OVH VPS environment with tenant-scoped PostgreSQL authorization and GitHub Actions CI/CD, health-checked deploys, automatic rollback, 150+ automated tests.

PixelPlates | Next.js, TypeScript, AWS, Supabase Postgres | github.com/INF124-Group25/pixel-plates June 2024

- Led 3-person student team building a full-stack restaurant-review app (REST APIs, auth, Drizzle ORM/Postgres) where I designed an AWS CDN + Lambda pipeline for cached, on-the-fly image resizing.

SKILLS & LANGUAGES

Languages: Java, C#, Python, TypeScript, JavaScript, SQL, C++

Frameworks/APIs: Spring Boot, .NET, Node.js/Express, React, Next.js, REST, Kafka, WebSockets, SSE

Databases: SQL Server, PostgreSQL, Qlik Replication, MongoDB, Supabase, Flyway

Cloud / Observability: AWS Lambda, S3, GitHub Actions CI/CD, Linux/systemd, nginx, Grafana

EDUCATION

University of California Irvine | *Software Engineering B.S.* June 2025

University of California Berkeley | *Sociology B.A.* June 2022
